

ABSTRACT

A computer program, and method are used in connection with a system article of manufacture, operator-system interface, and propagated signal for processing digital images, which are extremely flexible in terms of availability, connectability, and the number and types of receivable input formats and outputs. The computer program, article of manufacture, propagated signal, system, and operator/system interface permit users to input image information in a wide variety of formats, input the image information in many different ways, process the image information utilizing various techniques, in various languages, and produce outputs in a plurality of different format types and as a plurality of different products.
